

## HOT DRINKS MACHINE FOR COACHES

The Model 602 Hot Drinks Machine has been specially designed to fit into difficult and restricted areas in passenger compartments. The extremely compact water dispense head occupies the minimum of space, and can be mounted to a vertical surface such as next to a courier seat or side wall of a toilet compartment.

The dispensing head has a key switch to turn the machine off as well as lights to show heating and low water. Water is obtained from the heater by pressing the cup against the white lever. This operation can be done using one hand allowing the operator to safely retain hold of the vehicle at all times.

The water heater is situated in a side locker and heats from cold in about 20 mins. Next to the heater is mounted the cold water reservoir tank which automatically keeps the heater topped up with cold water. The reservoir holds about 125 drinks. The system is has many safety features and includes alternator sensing which only allows the machine to heat when the engine runs.
